Abstract

Background

Evidence for the health benefits of a physically active lifestyle amongst older adults is strong yet only a small proportion of older people meet physical activity recommendations. A synthesis of evidence identified “best bet” approaches and this study sought guidance from end-user representatives and stakeholders to refine one of these, a peer-volunteering active aging intervention.

Methods

Focus groups with 28 older adults and four professional volunteer managers were conducted. Semi-structured interviews were conducted with nine older volunteers. Framework analysis was used to gauge participants’ views on the ACE intervention.

Results

Motives for engaging in community groups and activities were almost entirely social. Barriers to participation were lack of someone to attend with, lack of confidence, fear of exclusion or ‘cliquiness’ in established groups, bad weather, transport issues, inaccessibility of activities, ambivalence and older adults being ‘set in their ways’. Motives for volunteering included ‘something to do’, avoiding loneliness, the need to feel needed, enjoyment and altruism. Challenges included negative events between volunteer and recipient of volunteering support, childcare commitments and high volunteering workload.

Conclusion

Peer volunteering approaches have great potential for promotion of active aging. The systematic multi-stakeholder approach adopted in this study led to important refinements of
the original ACE intervention. The findings provide guidance for active aging community initiatives highlighting the importance of effective recruitment strategies and of tackling major barriers including lack of motivation, confidence and readiness to change, transport issues, security concerns and cost; activity availability; and lack of social support.

Keywords

Older adults, physical activity, community engagement, intervention, volunteering, peer support, multi-stakeholder, qualitative
Introduction

Globally, the number of people aged 60 years or over is expected to increase from 841 million in 2013 to over 2 billion in 2050 (United Nations, 2013). Supporting healthy aging to reduce health and social care costs is an increasingly high priority for public health (World Health Organization, 2015; Foster & Walker, 2015). The evidence for the benefits of a physically active lifestyle is strong, illustrating consistent associations with better physical and mental health, improved mobility, well-being and reduced risk of all-cause mortality in older adults (Chodzko-Zajko et al., 2009; Hamer, de Oliveira, & Demakakos, 2014; Windle et al., 2010; Withall et al., 2014; Bauman, Merom, Bull, Buchner & Singh, 2016). However only a small proportion of adults over 65 years meet physical activity guidelines (Craig, Mindell, & Hirani, 2009; Department of Health, 2011). There are many gaps in the evidence base regarding how to support older people in increasing their physical activity. However, as the population ages and the demands for health and social care services increase, there is an urgent need to act (Stathi, Fox, Withall, Bentley, & Thompson, 2014). This is particularly pertinent as the connections between loneliness, isolation and ill health becomes more well-established (Cattan, White, Bond, & Learmouth, 2005).

Social connectedness is an independent predictor of older adults’ health and wellbeing (Vermeulen et al., 2011). Social isolation is related to depression, cognitive impairment (Stathi et al., 2012), lower self-rated health (Wahrendorf & Siegrist, 2010) and higher susceptibility to dementia (Cattan et al, 2005). Social activity is significantly related to daily walking episodes (Richard, Gauvin, Gosselin, & Laforest, 2009) and neighborhood connectedness is linked with lower barriers to physical activity (Walker & Hiller, 2007). Increased physical activity is a likely mechanism through which social connectedness may lead to these positive outcomes. Among older adults the frequency of trips outdoors is
associated with higher levels of moderate to vigorous physical activity (Davis et al., 2011),
better physical function and greater independence (Vermeulen et al., 2011). Frequency of
such trips out are influenced by a real or perceived lack of local amenities, activities and
groups (Marquet & Miralles-Guasch, 2015), confidence to engage with community activities;
social support and the availability of someone to attend activities with (Stathi et al., 2012).
This interaction between social connectedness, frequency of trips away from home and
physical activity suggest that policies that encourage community engagement may provide
several health and well-being benefits for older adults, particularly those who are currently
inactive and socially isolated.

Volunteering facilitates community engagement and is growing in popularity amongst older
adults (van Groenou & van Tilburg, 2012). Volunteering is positively associated with mental
wellbeing, quality of life, self-esteem, and reduced risk of depression (Cattan et al., 2005;
McDonnall, 2011; McMunn et al, 2009; Wahrendorf & Siegrist, 2010). It is also associated
with higher levels of physical activity (Tan et al., 2009), moderated or delayed mortality
(Okun, Yeung, & Brown, 2013), higher levels of social connectedness (Parkinson,
Warburton, Sibbritt, & Byles, 2010) and trips away from home (Morrow-Howell, 2010). A
limited number of studies have shown volunteer-driven physical activity interventions to be a
promising means of increasing participants’ activity levels. (Robertson et al., 2014).

This paper describes findings from qualitative work that helped modify and refine an active
aging intervention. The initial ACE intervention was the output of a 12-month multi-sectoral
collaborative network in the Avon region of the UK (AVONet), led by authors of this paper
(Littlecott, Fox, Stathi, & Thompson, 2015). AVONet synthesized evidence from a wide
range of sources, rigorously applied the UK Medical Research Council (MRC) guidelines and
good practice in participant and public involvement (PPI), in order to identify “best bet”
strategies for tackling low levels of activity in older adults and to provide pragmatic guidance for public health policy makers and practitioners (Craig et al., 2008; Stathi et al., 2014). It identified the potential for an active aging intervention promoting the ‘get out and about’ message and led to the development of a grant application for a pilot study of the Active, Connected and Engaged neighborhoods (ACE) intervention which was subsequently funded by the Lifelong Health and Well-being Initiative (Gateway to Research, 2015).

ACE was a two-year pilot study designed to test a practical, sustainable, and affordable approach to improving health and well-being in older adults by increasing trips out of the house, rather than directly promoting physical activity. ACE employed older volunteers (60yrs+) as ‘Activators’, to support socially isolated older peers to increase their involvement in community activities and subsequently increase physical activity, social engagement, and mental well-being.

The Process Model of Lifestyle Behaviour Change (PMLBC), which is an adapted version of the Health Action Process model, was used to map out the intended processes of behaviour change during the three stages of the ACE intervention: motivation, action and maintenance (Gillison et al., 2015; Greaves et al., 2015). In accordance with Self-Determination Theory (SDT), which has been used to underpin a range of physical activity interventions (Teixeira et al., 2012; Withall, Jago, & Fox, 2012), the ACE intervention particularly targeted the satisfaction of the need for relatedness, competence and autonomy (Deci & Ryan, 2002).

Best practices for the development of community-based interventions consider community and end-user involvement to be a crucial constituent (Horodyska et al., 2015; Whelan et al., 2014); while most successful interventions include substantial participation from key stakeholders (Economos & Blondin, 2014). The aim of this study was to seek feedback and guidance by end-user representatives (older group participants and older volunteers) and
stakeholders working in the area of active aging (volunteer managers) to refine ACE, a volunteer-led active aging intervention. This systematic, multi-stakeholder approach provides guidance relevant to other community initiatives where greater social engagement of isolated older adults is targeted.

Methods

Data collection

The study used a qualitative methodology as it is highly appropriate for increasing understanding of complex personal and social phenomena such as engagement in physical and social activities. Qualitative approaches are particularly useful when, as in this case, there is limited existing knowledge (Patton, 2002).

This study is informed by the principles of social constructionism, according to which knowledge is constructed through interaction with other humans and their world. This reality is developed and communicated in a social setting (Crotty, 1998).

We targeted diverse stakeholders with experience in community-based initiatives aimed at engaging older adults. Three key groups were identified: older adults (65yrs +) who had participated in community groups and activities (older group participants), adults (60yrs +) who were experienced volunteers (older volunteers), and professional volunteer managers experienced in working with older adults (volunteer managers). Focus groups were undertaken with the older group participants to enable triangulation of the data and for pragmatic reasons, as groups of participants were usually attendees at the same community group. Focus groups were conducted with volunteer managers and semi-structured interviews with older volunteers as this was their preferred interview method.
All participants lived or worked in the city of Bristol, United Kingdom. The study was reviewed and ethically approved by the University of Bath Research Ethics Committee (EP 11/12 98). During design, data collection, and analysis, we attended to the consolidated criteria for reporting qualitative research (COREQ) (Booth et al., 2014).

All interested participants were provided with a participant information sheet and written, informed consent was obtained prior to all interviews and focus groups. Demographic information was gathered on age, gender, ethnicity, education level and marital status.

The interviewers, JW, AS and JdeK, are all experienced qualitative researchers in the field of active aging. Theoretical saturation was deemed to have been reached when focus groups and individual interviews revealed no further unique information.

Focus groups and interviews were audio-taped using an Olympus VN2100PC digital voice recorder, transcribed verbatim and coded to ensure anonymity and confidentiality. All transcribed text was entered into NVivo Software for Qualitative Research 2002.

Data source 1 – Focus groups with older adults attending community groups and activities (Older group participants, n=28)

Older group participants were recruited at community groups such as lunch clubs, singing groups and IT courses for older adults. These groups were purposively selected from lists published by the City Council to reflect a range of age, gender and socio-economic background (Patton, 2002). We attended sessions to present the study and recruit participants face-to-face. Six focus groups were conducted between May and July 2012 and lasted 40-50 minutes.

An interview guide was developed to ensure consistency. The semi-structured format allowed participants to raise and explore related topics and issues. The opening question asked
participants for reflections on their experience of attending groups or activities. The main elements of the guide focused on the decision to participate including motives; barriers; expectations; positive experiences; negative experiences and the impact on day-to-day life. An outline of the ACE intervention was provided (see Appendix 1) and participants were asked for their first impressions; ACE’s suitability for older adults; recommended methods of recruitment; potential barriers to participation; enablers; ACE intervention structure and content. Two pilot interviews were first conducted with members of the target group. This process led us to refine the language used in the interview guide and to adopt a lay-person’s language where needed.

Data source 2 – Interviews with older adults who were experienced volunteers (Older volunteers, n=9)

Older volunteers were recruited via the community organisations for whom they volunteered. A cross section of voluntary organisations and roles were purposively selected to reflect a range of age, gender, and volunteering experiences (Patton, 2002). These included walk leaders, lunch club cooks and befrienders. Selected organisations approached suitable study participants and sought their permission to be contacted by the study team. Semi-structured interviews were conducted between May and July 2012 in local community centres or at participants’ homes, and lasted 30-40 minutes. The same interview guide was used as for the focus groups with the addition of an opening question exploring the reflections on experiences of volunteering.

Data source 3 – Focus group with managers of volunteering initiatives (Volunteer managers, n=4)

Volunteer managers were identified through established communications channels with major local service providers. One focus group was conducted in August 2012 with
professional volunteer managers from major UK statutory and third sector organisations; Age UK, Bristol City Council, LinkAge and Contact the Elderly. The interview guide explored volunteer managers’ experiences of recruiting, managing and working with volunteers, recruiting participants into programmes and their opinions of the ACE intervention structure and content.

Analysis

JW and JdK used Framework Analysis to code the data within the themes directed by the interview topic guide (Ritchie, Lewis, Nicholls, & Ormston, 2013). Additional themes and subthemes were identified as the data were analysed. The resulting coding structure was assessed by AS and other members of the research team, which guided the coding of the remaining data. Finally the derived themes for all three sets of data (older group participants, older volunteers and volunteer managers) were compared and similarities and differences were identified. The interpretation and analysis of the data were discussed and agreed by all seven authors (Gale, Heath, Cameron, Rashid, & Redwood, 2013).

The development of a coding scheme and a code checking protocol supported the dependability of the data. The data triangulation allowed for a comparison of the findings from two different methods of data collection and three different participant groups. This process allowed patterns of convergence to emerge and supported a comprehensive interpretation of the multiple data sources (Pope & Mays, 1995).

Results

Twenty-eight older group participants (25 female, 3 male, aged 65-85yrs) who attended community-based activities were recruited into focus groups (Data source 1). Nine older volunteers (6 female, 3 male, aged 65-78yrs) who worked with local voluntary groups were
interviewed (Data source 2). A further focus group was conducted with 4 volunteer managers (all female) (Data source 3). Participant characteristics are shown in Table 1.

The presented themes reflect the thematic structure of the interview guide: motivations, enablers of and barriers to engagement with community groups/activities; motivations, facilitators and challenges of volunteering; and reflections on ACE. Responses to the presentation of the ACE intervention (see Appendix 1) were broadly similar across older group participants, older volunteers and volunteer managers and these are presented together. Any differences are described and discussed.

**Motives, enablers of and barriers to engagement with community groups/activities**

These themes, sub themes and supporting data are presented in Table 2. The reasons older group participants chose to engage in community activities were almost entirely social. Their participation led to a significant increase in social connections and relatedness. Some older group participants actively sought opportunities to ‘get out of the house’ and engage with the outside world. Enablers of engagement were social support, in particular a companion to attend sessions with, and the availability of transport. Barriers to participation were not having anyone to attend with, lack of confidence (particularly to attend alone), fear of exclusion (from an established group) or ‘cliquiness’, bad weather and lack of access to transport.

**Motives, facilitators and challenges of volunteering**

Older volunteers’ motives for engaging in volunteering activities included personal benefits (‘something to do’, avoiding loneliness, a need to feel needed, enjoyment), altruism (to help the older generation) and external reasons (being asked to help by a friend/peer) (Table 3). The main positive impacts of volunteering were increased confidence, increased social contact and a sense of achievement and purpose. Difficulties in volunteering included
negative interpersonal events such as disputes with those being supported and/or their families, commitments to caring for grandchildren and high volunteering workload, which several interviewees highlighted as an issue that is often overlooked.

Enablers of volunteering included confidence, local knowledge and provision of good support to the volunteer. Hardly any barriers to volunteering were cited with cost, mainly relating to petrol and mileage, being the only major disincentive.

**Reflections on the ACE intervention structure and content.**

The following themes, sub themes and supporting data are presented in Tables 4, 5 and 6 respectively. Data below reflect the views of all three groups of participants in this study (older group participants, older volunteers and volunteer managers).

**Recruitment**

The ACE intervention was well received by all three groups and considered to be a highly worthwhile intervention but the challenge of participant recruitment was recognised by all interviewees who suggested a range of recruitment methods were discussed: Door-drops (leafleting) had a mixed reaction, as although they could potentially reach those who are quite isolated, they are often perceived as junk mail and dismissed. Recruiting at places where inactive older people might gather such as churches and sheltered accommodation was proposed, however individual face-to-face recruitment is time consuming and not always well-received. A personalised approach (letter) and the use of local media were suggested. Professionals and older volunteers advocated seeking referrals from General Practitioners (family doctors), social services and third sector organisations. Free food and drinks were commonly proposed to attract people to events. Table 4 shows the influences on recruitment as reported by older group participants and Table 5 as reported by volunteers. In order of
prevalence these were transport issues and accessibility of activities; ambivalence and being
‘set in their ways’; anxiety or lack of confidence to engage with groups or activities;
availability of a choice of appealing activities; security concerns and cost of attending
sessions and petrol and mileage.

The volunteer managers discussed the issues of recruitment and management of volunteers in
depth. Key mechanisms proposed for recruiting volunteers included word of mouth via
existing volunteers; recruitment of group participants; via community groups and events;
local media and volunteer recruitment organisations/websites (see Table 6). A face-to-face
conversation, an email exchange, completion of an application form, emphasis of the
commitment required and taking up references were all suggested elements of the screening
process. While retired volunteers often had low drop-out rates, issues of care of grandchildren
during school holidays could arise. An emphasis on the altruistic nature of volunteering was
also suggested as a motive for involvement. Paying expenses was thought to be an enabler of
a wider range of people volunteering. Experience showed that beyond the ‘compulsory’
initial training volunteers’ engagement with on-going training should not be time consuming
whereas adding a social dimension may be an incentive. Older volunteers emphasised the
importance of volunteers being thanked and appreciated. Having volunteer coordinators
available to help deal with problems, including over-demand from participants, was regarded
as more important than regular face-to-face supervision.

Meeting schedule and time commitment

The initial ACE intervention proposed 8-9 meetings between ACE Activators and their
participants over 6 months, starting weekly then reducing. There were concerns from all three
groups that this wouldn’t be sufficient to firmly embed participants in community activities.
Flexibility and reacting to individual participants’ needs were suggested. Regular meetings
were preferred to support habit formation. Flexibility was suggested to work around existing commitments.

The initial version of the ACE intervention suggested that each Activator work with 4-5 participants. This was considered too large a commitment by the older volunteers. Starting with one or two participants and then building was advised.

**Sustainability**

The ACE intervention aimed to use two mechanisms to sustain behaviour change. The first was to establish participants as regular attendees at activities and to support the building of social connections, thus enabling the Activator to gradually withdraw. Older volunteers in particular acknowledged that dependency could become an issue and that ‘stepping back’ should be supported. The second element was the forming of ACE participant groups to offer peer support and build an ‘ACE identity’ and sense of belonging. This was widely considered to be a beneficial approach without overlooking the individual participants’ preferences and readiness to change.

**Communication**

Computer and mobile phone use was slightly more common amongst older volunteers than older group participants. However, many of those who owned mobile phones commonly kept them for family use and/or emergencies and they were often not checked regularly. Very few older group participants used a computer regularly and most considered this to be common amongst their peers.

**Discussion**

The aim of this study was to seek feedback and guidance by end-user representatives (older group participants and older volunteers) and stakeholders working in the area of volunteering
(volunteer managers) to further develop and refine a volunteer-led active aging intervention. While it specifically informs the refinement of the ACE intervention, by reporting the barriers to, and enablers of, community activity engagement and getting out and about it also provides guidance for the development of other active aging community interventions. The findings of this study led to significant changes in the structure and content of the ACE intervention as outlined below.

**The ACE intervention**

The literature indicates that interventions with high contact frequency increase the likelihood of behaviour change (Greaves et al., 2011). However, in a public health setting this needs to be balanced with financial constraints and programme sustainability. The number of meetings between Activators and participants suggested in the initial ACE intervention was regarded as too prescriptive. Therefore, the intervention was adapted to guide Activators to provide support flexibly until participants became confident to attend activities alone.

The power of a group setting in facilitating engagement in organised activities is well-known (Burke, Carron, Eys, Ntoumanis, & Estabrooks, 2006). The findings of this study stressed the importance of social interaction among the ACE intervention participants as well as between activators and their supported participants. As a result, the number of opportunities for ACE participants to meet each other was increased to facilitate the formation of social networks and build an ‘ACE’ group identity, defined as a shared sense of belonging to the ACE group. However, it was stressed that the Activators’ training should actively consider individual participants’ preferences, confidence and readiness for forming ACE groups.

The initial ACE model anticipated that each Activator would support 4-5 participants. The findings of our study indicated that this was likely to be too great a burden and that a more manageable number would be 2-3 participants per Activator as a maximum.
This study highlighted the importance of participant autonomy and therefore it was decided
that although the scheduled meetings would be regular to help participants establish routines,
they should be arranged around participants’ schedules and not be pre-set. Free and low cost
activities were incorporated into the list of local activities provided. This list was intended to
be a dynamic, allowing participants to add their own knowledge of local initiatives and
further enhancing their autonomy.

Forty per cent of older adults use e-mail or text messaging and 42.7% use the internet, with
higher usage associated with younger age, male gender, white race and higher education level
(Gell, Rosenberg, Demiris, LaCroix, & Patel, 2013). However, data from this study indicated
that mobile phones and computers are only used regularly by a minority of the target group,
indicating decisions based on national statistics should be made with caution for this cohort.
As a result, it was decided that ACE intervention would primarily rely on paper-based
methods of communication while monitoring the use of electronic devices for future
intervention adaptations.

Recruitment
Recruitment is an issue that confounds the potential impact of many public health
interventions (Stineman et al., 2011; Withall et al., 2012; McHenry, Insel, Einstein, Vidrine,
Koerner, & Morrow, 2015). It was the first issue raised by most older group participants and
older volunteers; ‘How would you get these people to come?’ Clearly effective recruitment
strategies tackling the major barriers to participation (lack of motivation, confidence and
readiness to change, transport issues; security concerns and cost) were essential if the ACE
intervention was to be fully tested as a feasible community-based public health intervention.
The ACE recruitment materials and the Activator training programme were refined to focus
on addressing these barriers.
A lack of confidence or competence amongst potential participants has been shown to negatively impact engagement, particularly in physical activity (Costello, Kafchinski, Vrazel, & Sullivan, 2011). This issue was commonly cited and reinforced the importance of ACE’s focus on ‘getting out and about more’. Low confidence often leads to a powerful reluctance to attend an unfamiliar group alone (Crombie et al., 2004; Withall et al., 2012), with a particular fear of feeling excluded by a long-established social network or ‘cliquiness’. This data strongly supported the ACE intervention focus on providing ‘someone to go with’ (the Activator) as a means to tackling concerns about attending alone, and providing an ally in establishing connections with the group. ACE recruitment materials were adapted to highlight the provision of this support to help those affected overcome this barrier. In addition a focus on day rather than evening activities and a reference to the involvement of all academic institutions involved were added to the materials to tackle any security concerns.

There is significant evidence that ambivalence and being ‘set in their ways’ negatively impacts the adoption of improved health behaviours amongst older adults (Crombie et al., 2004; Moschny et al, 2011). This was tackled in the recruitment materials by placing more emphasis on the breadth of activities available, through providing several examples of groups and programmes to suit a wide range of interests. Opportunities for socialising are a powerful motivator for older people to engage in activities and the findings of this study strongly supported this (Devereux-Fitzgerald et al., 2016). This became a major focus of the ACE intervention recruitment materials, as was the role of the ‘Activator’ as an important source of social support and social interaction.

Many of the recruitment mechanisms proposed in this study have been routinely tested as methods of recruitment into research (Knechel, 2013; McMurdo, Witham, & Gillespie, 2005). However, despite direct, personalised invitation to participate being a relatively successful means of recruiting research participants, it is not an approach commonly used in
public health programmes. Based on the findings of the study it was decided that the ACE recruitment process would include direct approaches to sheltered housing complexes; the seeking of referrals from social services, churches and a wide range of community groups and the utilisation of local media (newspapers and radio), but that the main thrust of the recruitment strategy would be a personalised mailed invitation supported by a leaflet door drop.

Volunteers are vital to many community-based interventions (Time Bank, 2015), without whom success and sustainability are jeopardised. However, there is limited literature available to provide guidance on maintaining commitment and avoiding drop out. The findings of this study indicate some key strategies for tackling these issues. These include making the level of commitment required clear at recruitment; establishing a thorough screening process ideally incorporating an application form; providing a detailed and realistic role description; organising a face-to-face meeting and requiring references. The older volunteers stressed that overburdening volunteers with supervision and training should be avoided. As a result Activators’ supervision meetings were organised in groups rather than one-to-one, incentivising attendance with an opportunity for social interaction and exchange of experiences, successes and challenges. The identification of the importance of high quality volunteer support led to the enrichment of the ACE intervention with a paid volunteer Coordinator role who would provide Activators with support and advice, acknowledgement and appreciation.

Theoretical implications

In accordance with the Process Model of Lifestyle Behaviour Change (PMLBC), the theoretical framework of the ACE intervention, the findings highlighted that behaviour change amongst the target group would not be a linear process and that specific attention had
to be paid to supporting motivation and activation and sustaining behaviour change (Gillison et al., 2015).

In order to address these challenges we incorporated Motivational Interviewing techniques (Miller & Rollnick, 2012) into the Activator training programme providing simple tools and techniques with which to evaluate readiness to change and tailor the motivational plan to the individual’s needs. Adhering to the PMLBC, and based on the findings of this study, some on-going face-to-face support and increased telephone support was also added to the Activator role.

The findings of this study provide further support for fine-tuning the intervention to satisfy the need for relatedness, autonomy and competence according to the principles of Self Determination Theory (Deci & Ryan, 2002; Teixeira et al., 2012). As a result we included limited-term support (6 months) with a detailed action plan for gradual disengagement of the Activators to avoid creating dependencies. We enhanced relatedness with the provision of social support via an Activator, the facilitation of relationships building at community activities and the creation of ACE participant groups.

**Strengths and weaknesses**

The major strength of this study is the provision of an example of best practice in the development of an intervention using a systematic multi-stakeholder approach with Participant Public Involvement [PPI] at its heart. Using a rigorous approach, this study identified a comprehensive list of factors that could positively impact recruitment and retention of older adults and older volunteers into an intervention designed to increase physical activity and community engagement. This study also described the process of refining an intervention, addressing practical issues and increasing the possibility for success.
The three groups of participants (older group participants, older volunteers, volunteer managers) were recruited via different recruitment strategies, with the aim of developing an in-depth understanding of a phenomenon (engagement in community groups and activities) rather than making probabilistic generalizations to a population (Popay, Rogers, & Williams, 1998). The different perspectives reported show the importance of having such a broad range of inputs which is a key element of all phases of ACE development.

All recruited participants in this study had experiences of engaging with some form of community activity. They might not have provided a full account of the barriers people who never engage with such activities might face. However many participants only engaged with one group and were able to present the challenges of engaging with unfamiliar groups. In addition people who volunteer to participate in active aging studies may differ from those who do not as they are usually more physically and socially active, healthy and have higher socioeconomic status. Finally, all participants were white British; this limits the generalizability of the findings as they are not reflective of the views of ethnically diverse older adults.

**Conclusion**

The initial ACE intervention was refined using a systematic multi-stakeholder approach and with close adherence to guidelines for developing complex interventions. This rigorous approach led to the refinement of the ACE intervention in order to be tested at a subsequent stage for feasibility and acceptability via a pilot study. The fact that ACE is rooted in community thinking with PPI at its heart increases its potential to transfer successfully to a community setting, once effectiveness and cost-effectiveness have been established. The findings also provide guidance for similar community initiatives by highlighting the importance of effective recruitment strategies that tackle major barriers (lack of motivation,
confidence and readiness to change, transport issues, security concerns and cost); offering a
range of appealing activities; actively supporting increased social interaction and providing
social support to attend. In volunteer-led schemes being clear about the level of commitment
required and thorough screening are key, while excessive supervision and training should be
avoided. Volunteers appreciate being well-supported and having their contribution regularly
acknowledged.

The positive reaction of all stakeholders towards the ACE intervention indicates that there is
a strong potential for peer volunteering approaches developed using the Process Model of
Lifestyle Behaviour Change and underpinned by Self-Determination Theory, to support older
adults in engaging in community activities. This theoretical framework will be evaluated
through a rigorous process evaluation in subsequent studies.

Acknowledgements

We would like to thank all the study participants for their time and generosity.

</tbody>
</table>
Barriers to activity participation

- Lack of confidence
- Lack of social support
- Sense of exclusion
- Weather
- Transport

FG2 P4...on your own you don’t know who you are going to meet
FG3 P4 Nervous, I’m always nervous the first time I go anywhere...as long as you’ve got someone to go with
FG4 P1 It’s open to everybody except me..
FG3 P4 I know people who’ve gone, even to churches and it’s very cliquey, no-one talked to them and then that’s it isn’t it
FG3 P1 We had that in the club ‘Oh don’t sit there that’s so and so’s seat’ and I said ‘it’s anybody’s seat’
FG2 P3 Unfortunately it’s to do with the weather because people don’t get about if it’s raining.
FG2 I can’t get around to get to the bus stop...it’s such a long way to walk. I go to things that are near by.

Table 4 Data source 1. Results from focus groups with older group participants reflecting on the ACE intervention (6 groups, n=28)

<table>
<thead>
<tr>
<th>Main Theme</th>
<th>Sub-theme</th>
<th>Sample data</th>
</tr>
</thead>
<tbody>
<tr>
<td>First reactions to ACE</td>
<td>FG6 No, it’s very worthy and I hope it’s successful</td>
<td></td>
</tr>
<tr>
<td></td>
<td>FG6 It’s a good idea</td>
<td></td>
</tr>
<tr>
<td>Potential influences on Transport</td>
<td>FG2 It’s all very well...but if you can’t get to the places it’s rubbish really</td>
<td></td>
</tr>
<tr>
<td></td>
<td>FG2 Well I think the essential thing is the transport... It’s all very well hearing of all these nice things if you can’t get there.</td>
<td></td>
</tr>
</tbody>
</table>
FG1 Some people are incredibly shy and don’t really want to get involved with others. Some do tend to retreat within themselves.

FG3 I think lots of people would like to do things but can’t get that step forward.

FG5 There’s a lot would rather be on their own, they don’t want to participate

FG1 Some people think they’ve done enough. FG6 They get like that. They just see an invitation and they just recycle it. My mum got like that.

FG1 You need a choice of activities going on, because I can imagine there’s some places where there’s not much happening.

FG2 It’s just knowing what’s available for a lot of people.

FG1 You need to be sure the Activators are honest you’ve got to break down that mentality that everybody is dishonest...

FG5 Everything costs money. People go to a couple of them. They can’t get it all can they, because it all costs money.

FG2 How would you get these people to come?

FG5 How are you supposed to find them if they never go anywhere?

FG2 Lots of people would like to do things but can’t get that step forward... if something went through their door they might think oh I’ll ring that

FG3 With leaflets not everybody reads them.

FG3 We’re lucky here because we come to church and you get told what’s going to happen through the week.

FG6 I think you’re going to have to go into existing groups really – and extend that. They will all know somebody who...

FG3 Our history lady she always writes to us doesn’t she?

FG3 I always if I’m on the bus pick up a Metro. You see things in there.

FG1 I think food is always good, food available and drink.

FG1 Well I don’t think a couple of weeks (at once a week) would be sufficient because they’ve only just got into their heads that they are going out. I think a month – 6 weeks would be better than 2 weeks because they’ve got to get into the habit of going

FG3 Meet 3 or 4 times then make an adjustment if you need to, ask them ‘what do you think’, get some feedback.

FG1 I would certainly prefer to know if it was every Wednesday or every Tuesday. I would prefer it to be scheduled...

FG6 At the person’s home? Some people are cautious about... With vulnerable adults you have to be very careful on one to one.

FG1 They ought to get to know their Activator first and before they become part of the wider group. I think that might be better.

FG5 You get a volunteer to go see 3 people and then there’s another volunteer that goes to see a different 3 people and then they could say ‘Right shall we all try and get together and have a cup of tea’ So you’ve got 6 people who are meeting for a cup of tea

FG2 I can but I don’t give my number out to anybody except for family...if I fall down

FG5 I’ve got one... I can’t use it

FG3 Most people have got their phones and computers it’s just that we haven’t

FG1 When you are dealing with older people you have to bear in mind that more 70 year olds don’t use computers...

Table 5 Data source 2. Results from interviews with older volunteers reflecting on the ACE intervention (n=9)

<table>

<tr>
<th>Theme</th>
<th>Sample data</th>
</tr>
</thead>
<tbody>
<tr>
<td>First reactions to ACE</td>
<td>P2: I don’t think it’s good I think it’s more than that, I think there’s a need. I think there is a need for it.</td>
</tr>
<tr>
<td></td>
<td>P9 I think the idea behind it is good, all these bridges are very important,</td>
</tr>
<tr>
<td></td>
<td>P10: I think it’s a wonderful, wonderful idea.</td>
</tr>
<tr>
<td>Participant recruitment</td>
<td>P5: It’s a good idea, the only thing is...the people you’re trying to get to is often the hardest people to get to... I don’t want to sound pessimist, your biggest problem is getting to these people really,</td>
</tr>
<tr>
<td></td>
<td>P6: I don’t know how you will persuade someone to go out...but it does take a huge step</td>
</tr>
<tr>
<td>Lack of</td>
<td>P2 when you haven’t done it for ages you get this thing about... I wonder if I’ll like it, I wonder if anybody will be there’</td>
</tr>
</tbody>
</table>
Other commitments

P2: ‘I’m too old’, it’s their mental attitude, ‘I’m retired, I’m retired not, I can’t do that’, ‘I can’t do this’, ‘I can’t do that’.

P5 It’s quite surprising how many people although they’re retired, are committed... 7 days a week, for grandchildren. If you’ve got grandchildren in school, all that sort of thing. It does happen

Recruitment methods

Referrals

P2 I mean that’s the way you’re going to find out, the Social services and the NHS,

Direct contact

P1 Block knocks. Knock on every door in every tower block... and just listen. You see what they say. We’ve had a tremendous success with... that. We entered the blocks, we listened... we listened to what they said and we did it.

Media

P2: The media is very good to use, we don’t use it enough as far as we’re concerned. The local press, you know...and but photos and those sort of things, that would be, there would be photos in the paper and people would say ‘oh what’s that’

Leafletting

P5 I did a lot of work, I went everywhere I went to every church in the area, I think the best form of advertising, especially these days quite frankly, is leaflets through doors. I don’t think how else you could do it other than a leaflet drop.

Personalised mail

P10: Older people like letters and cards. With our folk quite often a letter will go out, or a card will go out, they love that. ‘oh it came through the post’ (laughs), and it’s really, really important that it’s hand written. I want to open it then.

ACE structure

Frequency

P6: I think it’s at least once a week. A week is a long time, sitting on their own.

P10 I think you are right that you would need 3 or 4 meetings and then you could step back for a while, otherwise the person you are meeting with will become too reliant on you, and that would be a danger in a one to one situation.

Forming participant groups

P10: I think the activator will know when the time is right to bring the folk together, it may be ‘well I’ll bring those two together’, and see what happens, and then ‘let’s see if we put the other two together’, but the activator will become very aware of the needs.

P6: little groups together? That would be a good idea.

We expect each volunteer to support 2 or 3 people, do you think that’s too much?

P6: That’s probably too much. You should start off with one and move on from there.

Managing volunteers

Peer support

P1 It will build them a support system, by being together, and also it will be an opportunity to exchange information....

P9 I think initially, possibly when people are unsure about how it’s working and perhaps get a little thing going, to help thank,

Supervision

P4: Um... once every 6 weeks or something? You wouldn’t want it too often

P9: I don’t know, we did try during a volunteer … meeting and that didn’t really get off the ground you know, so...

Role of coordinator

Providing someone to talk to

P3 It would be nice to have a back up, somebody call you and see how it’s going, and vice versa.

P10: ... A listening service (laughs) first and foremost.

P10 Best management manage volunteers? you’ve got to listen...and always leave them a way out. Very important.

Communication

Internet/email

P1 People use phones and um, people send me emails, I don’t read them, I’m a dinosaur I like to talk to people.

Mobile phones

P6: I think I’ve put a fiver on it since I’ve had it. 2005. It’s in my hand bag, I never use it.

P2 I use it myself, but what I’m saying is you’ll find that because some people can’t they’ll say ‘oh can’t use the computer’

Table 6 Data Source 3 Results from focus group with volunteer managers reflecting on the ACE intervention (n=4)

<table>
<thead>
<tr>
<th>Theme</th>
<th>Sub theme</th>
<th>Sample data</th>
</tr>
</thead>
<tbody>
<tr>
<td>Volunteer recruitment</td>
<td>Word of mouth</td>
<td>P1: Word of mouth is a huge one ... if your neighbour or your friend has done it...</td>
</tr>
<tr>
<td></td>
<td>Referrals</td>
<td>P2: So it’s agencies working together, knowing about each other and referring people on,</td>
</tr>
<tr>
<td></td>
<td>Utilising group participants</td>
<td>P3: we have a sort of ‘Grow your own volunteer’ model....people get involved in the scheme, get engrossed in the group and start to own it.... we encourage that, skill build, confidence build</td>
</tr>
<tr>
<td></td>
<td>Volunteer agencies</td>
<td>P4: We advertise on VOSCUR (Supporting Voluntary Action) if we want to fill specific roles and utilise Volunteer Bristol a lot as well.</td>
</tr>
<tr>
<td></td>
<td>Press relations</td>
<td>P3: Working through the volunteer agencies people will come for a bit, they don’t have that sense of ownership....</td>
</tr>
<tr>
<td></td>
<td>Local groups/</td>
<td>P1: We did get people through campaigns in newspapers.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>P3: I personally feel that the Neighborhood Partnerships are a really good source of support. ...they have various forums and monthly</td>
</tr>
<tr>
<td>Screen Volunteers</td>
<td>For Suitability</td>
<td>P1: We’ve got an application form, and I’ll talk or have an email chat with somebody. We also take up two references.</td>
</tr>
<tr>
<td>-------------------</td>
<td>-----------------</td>
<td>------------------------------------------------------------------------------</td>
</tr>
<tr>
<td></td>
<td>For Commitment</td>
<td>P3: We would go through the role with them and the tasks so they know whether they want to commit to it or not.</td>
</tr>
<tr>
<td>Minimising Volunteer Drop-out</td>
<td>Commitment Clarity of commitment</td>
<td>P4: Make it really clear. 6 months, have that end goal (the ACE commitment would be 12 months)</td>
</tr>
<tr>
<td></td>
<td></td>
<td>P2: Just having to fill in that form and think about the commitment all helped weed out the ones that aren’t bothered.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>P1: You’ll be surprised most people will probably stick the course if you are up front at the beginning about the commitment involved and what the role involves as long as you give people enough information.</td>
</tr>
<tr>
<td>Minimising Volunteer Drop-out</td>
<td>Reinforce altruism</td>
<td>P3: It’s the altruistic element of volunteering so the more you reinforce that and how worthwhile volunteering is then people will continue</td>
</tr>
<tr>
<td></td>
<td></td>
<td>P2: You should definitely find out whether they have any child care responsibility because some volunteers ...basically can’t do a lot of volunteering during the summer holidays because they have to look after their grandchildren.</td>
</tr>
<tr>
<td></td>
<td>Other commitments</td>
<td>P4: Make it really clear. 6 months, have that end goal (the ACE commitment would be 12 months)</td>
</tr>
<tr>
<td></td>
<td></td>
<td>P2: To be honest the take up has been a bit disappointing... and they are usually the ones who are more engaged</td>
</tr>
<tr>
<td></td>
<td></td>
<td>P1: We put on all sorts of wonderful training and think people will be really interested... the take up is quite bad (Yeah)</td>
</tr>
<tr>
<td></td>
<td></td>
<td>P3: It is how you package it, there has to be something that is appealing to them, rather than a formal training session.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>P3: it’s a recognised training. Something that they feel proud they’ve actually achieved, although it’s not an onerous training it’s practical as well, and at the end of that day they all go away feeling ...so it’s a booster.</td>
</tr>
<tr>
<td>Volunteer Training</td>
<td>Formal or Informal</td>
<td>P1: I meet all the volunteers that can make a day...I’ll go through the manual and answer lots of questions. We don’t do formal training.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>P1: To be honest the take up has been a bit disappointing... and they are usually the ones who are more engaged</td>
</tr>
<tr>
<td></td>
<td></td>
<td>P3: We put on all sorts of wonderful training and think people will be really interested... the take up is quite bad (Yeah)</td>
</tr>
<tr>
<td></td>
<td></td>
<td>P3: It is how you package it, there has to be something that is appealing to them, rather than a formal training session.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>P3: it’s a recognised training. Something that they feel proud they’ve actually achieved, although it’s not an onerous training it’s practical as well, and at the end of that day they all go away feeling ...so it’s a booster.</td>
</tr>
<tr>
<td>Managing Volunteers</td>
<td>Low Take Up of Supervision</td>
<td>P4: ...we invite them to meetings once every six months but take up isn’t brilliant. Group supervision is a really good time saving tool.</td>
</tr>
<tr>
<td></td>
<td>Non Face to Face Contact</td>
<td>P3: We have a volunteer forum. It was a good idea but unfortunately the take up wasn’t brilliant so after about a year it just stopped... the take up is low</td>
</tr>
<tr>
<td></td>
<td>Peer Support</td>
<td>P3: I think the trust has been built to the extent that we don’t necessarily have to see them regularly they just know they can call. And we support with lots of communication, newsletters, bulletins and emails... volunteer thank you events so they feel recognised and supported</td>
</tr>
<tr>
<td></td>
<td></td>
<td>P1: I couldn’t possibly talk to all my volunteers, the coordinators are my point of contact... if they’ve got a problem they can come to me</td>
</tr>
<tr>
<td></td>
<td></td>
<td>P2: Peer support can be really, really useful. The same issues come up, the same questions. It’s just incentivising them to do it really</td>
</tr>
<tr>
<td></td>
<td></td>
<td>P2: It is nice for them to be able to get together and talk about their individual experiences</td>
</tr>
<tr>
<td>Participant Recruitment and Retention</td>
<td>Recruitment Methods</td>
<td>P2: The community mental health team... they might be able to help you... Community Police Support Officers?</td>
</tr>
<tr>
<td></td>
<td>Transport</td>
<td>P3: The Council Housing and Tenancy support network is very good. Health Centres have newsletters that go out.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>P2: That’s usually when they stop going to things when they can’t get transport. That’s a huge issue.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>P2: What if it’s raining and the bus doesn’t turn up</td>
</tr>
<tr>
<td>Volunteer (Activator) Role</td>
<td>Workload</td>
<td>P1: You might find that once people have met with someone a few times they might be more confident to take on more people.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>P2: That’s quite a lot of visits for one volunteer in a week.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>P2: Every Activator would have four to five participants to support?</td>
</tr>
<tr>
<td>ACE structure</td>
<td>Venue</td>
<td>P1: If they have lost confidence or are scared of getting out then ... go to their homes, have a cuppa with them</td>
</tr>
<tr>
<td>Meeting venue, scheduling</td>
<td>Organisation</td>
<td>P1: Flexible, that the two people can arrange together</td>
</tr>
<tr>
<td></td>
<td>Communication</td>
<td>P2: I’d say don’t exchange numbers. That keeps an appropriate distance between people. The coordinator could be the go between</td>
</tr>
<tr>
<td></td>
<td>Participant group meetings</td>
<td>P2: And I suppose it could compare the goals they’d been set as well... Talk about what groups they might be getting involved in, what they’d like to do. Like Weight Watchers where everyone motivates everyone else.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>P3: Could be very simply over a coffee... you get the people together and they don’t feel like they’re being pushed into something.</td>
</tr>
<tr>
<td>Role of Coordinator</td>
<td>Skills</td>
<td>P2: I’ve put in the role to build team spirit and have occasional get togethers with the befrienders.... the coordinator can facilitate that.</td>
</tr>
<tr>
<td></td>
<td>Responsibilities</td>
<td>P2: It’s quite a special role...for someone has the social and organising skills</td>
</tr>
<tr>
<td></td>
<td></td>
<td>P2: The coordinator could keep an eye on the boundaries between volunteers and participants and make sure they are not becoming too involved, and that the older people aren’t making unreasonable demands on them.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>P3: An audit of what is available locally. The coordinator could work with other local contacts to do that.</td>
</tr>
</tbody>
</table>
