Marcus Grant records the key events in a year of working to bring the worlds of public health and planning together

2006 – a year of health and planning

February

Hugh Barton – Director of the WHO Collaborating Centre – is working on the European front, while I tend (or try to light!) some home fires. Hugh is in Milan at a WHO Healthy Cities sub-network meeting to promote a healthy urban planning theme. Hugh is working with the cities leading this theme, such as Belfast, Brighton, Bursa, Turku and Milan, to set some ground rules and an agenda for the next three years.

Our main role has always been to support the WHO Healthy Cities network across Europe. These cities have all signed up to the current five-year phase of the Healthy Cities programme. This phase places an emphasis on what has been termed ‘healthy urban planning’ – which means using spatial planning, at all available scales, to help create settlements where it is easier to live a healthy life. In practice, in addition to spreading theory and good practice, often the key task for us is just to get planners and public health practitioners to speak to each other. In a sense they share common goal but they certainly don’t share a common language. They don’t have a similar *modus operandi* and hold few joint conferences – until this unusual year.

Here in the UK, I am at a Royal Town Planning Institute (RTPI) conference called ‘Spatial Planning and Health’ being held in Birmingham. This bodes well: it is a good start to a year to have planners and professionals from the NHS and the Department of Health (DOH) in a single dialogue. My overriding impression is of planners discovering that they didn’t know what health actually meant, and that they would need to develop a definition. I always find it encouraging when people start to see things through new eyes: redundant patterns of thought start to be challenged; the table is laid for change. The summing-up from Caroline Brown has been influencing our approach here at the WHO Centre and I hope many others. In a nutshell she discerns three distinct agendas for planning and health:

- **1** – planning of health care facilities and estates;
- **2** – planning that reduces environmental causes of disease; and
- **3** – planning that promotes healthy lifestyles and healthy communities.

Our WHO collaborating centre is mainly concerned with 2 and 3 – although if as society we do 1 properly, I think it will be through realising that it, too, should be more concerned with 2 and 3!

March

The beginning of the month sees Hugh giving a masterclass on health improvement through the new planning system for the healthy cities team and stakeholders in Brighton, hosted by the Brighton and Hove City Primary Care Trust.

In mid-month, Hugh and I travel to Telford for the 14th Annual Public Health Forum. This two-day event, with about 600 attendees, has become a key debating and networking date in the annual calendar for a wide range of those who identify with a broad health and well-being agenda. The event is run by the UK Public Health Association (UKPHA), with Angela Mawle at the helm. In addition to the community health specialists and NHS health promotion teams, the forum is increasingly the place for environmentalists, urban designers, planners and those involved in all aspects of community regeneration to challenge the medical hegemony on ‘health’. It is where those researching the links between the built and natural environment and health can test assumptions and learn from practitioners.

I am pleased that a small team of us, called the Strategic Interest Group (StiG) at the UKPHA, has prepared a special conference strand as a hub for practitioners working in the built and natural environments. Participants hear how we have been literally building unhealthy conditions into our local human habitat.

During the two days of presentation, it becomes clear that recent concerns about levels of physical activity, obesity and asthma and increasing environmental inequality have put planning back on the health agenda. Human health is being compromised by both the manner of human intervention in the natural world and the manner of development activity in our built environment. However, taking action is not necessarily simple: the links between health and planning are indirect and complex.
The forum gives Hugh and me the opportunity to give our ‘health map’ its first major public outing. Feeling that a tool to improve understanding and foster collaboration between planning and health decision-makers was badly needed, we have designed the health map as a dynamic tool to promote dialogue and provoke enquiry. It has been deliberately composed to provide a focus for collaboration across practitioner professions – for practitioners such as planners, public health professionals, service providers, ecologists and urban designers – and across topics such as transport, air quality, community development and economic development.

April

Hugh is invited to put the case for ‘putting human well-being at the core of planning’ to a plenary session at the Seventh International Health Impact Assessment Conference, held in Cardiff. We are missing a trick, he suggests: the new planning system and the community strategy offer mechanisms to integrate health and planning – we need to grasp the opportunity.

Later in the month, we host a public health showcase at UWE, sub-titled ‘Convergence of the Public Health and Sustainability Agendas?’. The question mark (big and pregnant) is an attempt to highlight the importance of connecting these two all too separate worlds. The UKPHA lends us its Chair, Professor David Hunter, to open the event and I find it encouraging that our Regional Director of Public Health, Dr Gabriel Scally, challenges planners to get more serious about planning for healthy communities. We deliberately try to immerse participants in the debate using exhibitions, workshops, talks and locally-sourced green organic fare.

In the interstices of the month Hugh puts the finishing touches to a series of papers, for the WHO, the Smart Growth Foundation and the National Heart Forum.

May

Hugh and I work on split fronts again. Hugh draws the short straw, having to attend the WHO Member States’ Intersectoral Consultation on promoting physical activity for health in Ljubljana, Slovenia! His presentation on urban planning is to help shape the WHO recommendations to the Ministerial Conference on Counteracting Obesity (held in Istanbul in November 2006).

Meanwhile in the UK, and just up the road from UWE, our local Director of Public Health, Chris Payne (of South Gloucestershire Primary Care Trust), lines up speakers from Sustrans, Arup and other built environment consultancies to address health practitioners. I present an overview of how urban design can affect health. Presentations drive a coach and horses (or should that be tram and light rail?) through traditional divisions between sustainable development, health, community, design and planning.

June

You win some, you lose some. The Natural Environment Research Council launches its new Environment and Human Health programme. I am invited to the speed-dating process that will build bidding partnerships. Although I meet a lot of fine people doing fine work, all the ‘social scientists’ (as planners have become in this forum) bemoan the lack of any real understanding of ‘interdisciplinary’ processes and ‘holistic’ systems. I am disappointed; the funders only want research directly linked to provable causal ‘pathogen’ style pathways. No room, then, for a healthy cities approach!

Later in June another bunch of cities apply to join the Healthy Cities Network. Hugh and I assess the ‘healthy urban planning’ element of the applications and report our conclusions to Healthy Cities HQ. We get applications from a number of cities in Eastern Europe – Dimitrovgrad, Trabzon, Kuressaare, Sarpsborg, Tirana and Istanbul. We find it encouraging that cities struggling with (sometimes immense) basic infrastructure problems nevertheless grasp the importance getting the underlying emphasis right.

July

Oh dear, that time of year when we need to provide WHO Healthy Cities HQ in Copenhagen with information for its Annual Report to the cities. Lots of data-crunching and deadlines. We try to assess what cities are up to, who is working well and which cities might benefit from extra support.

At UWE we have a large and established planning teaching programme. Last year the Faculty was commissioned by the Department for Communities and Local Government to provide online resources to ‘change the culture’ of planning. I think this refers to giving planners a ‘spatial planning’ mind-set. Inspired by the RPTI conference in February and other developments earlier in the year, I audit the new ‘Spatial Planning’ distance learning course to make sure that ‘health’ is adequately addressed. As a result I commission Ben Cave to write a topic which will serve as a primer for the planning-health agenda. Hugh writes another topic focusing on one of our ‘tools’ – ‘spectrum appraisal’, which links health and sustainable development, combining rational and stakeholder approaches.

August

No sooner have we written the topic on spectrum appraisal than we are asked to undertake another assessment using this technique. We are been asked, through Powell-Dobson Urbanists, to undertake a sustainability appraisal of current housing policy for Merthyr Tydfil County Borough Council. Armed with the spectrum approach and the ‘health map’, we successfully argue for undertaking an integrated health and sustainability appraisal. Hugh uses the fallow period to plan a new planning text book which puts health at the heart of planning.

September

The month is mainly spent vetting the ‘healthy urban planning’ elements of new
cities wanting to join the European network. Applications to become Healthy Cities arrive from Kirrikale, Gijón, Cherepovets, Sarajevo, Salamanca and Nancy. For some cities, the concept of ‘healthy urban planning’ does not yet go much further that some open space improvement works and a cycle lane. But the leading cities demonstrate how the agenda goes beyond just the physical infrastructure as an end in itself, to how it becomes the means for inclusion, capacity-building, governance and partnership.

We are also invited to undertake a pre-planning-application update of a health and sustainability appraisal for the Clarks’ residential Houndwood development in Street. The former shoe factories are giving way to 400 houses, and the client wants an exemplary scheme of a healthy sustainable Street. The seminar includes a day of masterclasses for architects and stakeholders. In the afternoon I give a half-day ‘Healthy Urban Planning’ seminar in Belfast. I have been invited to facilitate a ‘Integrating Spatial Planning and Health’ – pending new Health Impact Assessment and Health’ – special issue. Hugh attends the final consultative workshop (organised by the Department of Health) on ‘Strategic Environmental Assessment and Health’ – with Government guidance; and he inspires (so he says!) the participants at the Regional Studies Association annual students conference with new ways of assessing settlement sustainability. The health map of Sustainable cities has just been published for the first time: Hugh and I have managed to get a very good reproduction with an associated short article into the Town & Country Planning Journal of the Royal Society for the Promotion of Health, 2007, Vol. 76, Feb., pp.57-58. For a deeper explanation from the perspective of planning theory, see H. Barton: ‘A health map for human settlements’.

Notes

We celebrate!

As I reflect on the year, the message that the environment in which we live is a major determinant of health and well-being is being accepted as a context for action in an ever widening consensus, like ripples on a lake. The sentiment that ‘modern town planning originated in the 19th century in response to basic health problems, but in the intervening years has become largely divorced from health’ is a statement that we have heard echoed in conferences this year from platforms organised by the RTPI, CABE, the Urban Design Group, and a host of other built environment interests. Health conferences, too, are now beginning to reverberate to the same message.

Over the year we have seen a developing pace of interest in debate; but dialogue and activity often remain frustratingly superficial. It is not the complexity of the two professional spheres that is a barrier per se, but we are still awaiting the development of professional mindsets that can hold such complexity without a need to simplify and lose the gifts that it has to offer. My hope is that planners will make a genuine attempt to grasp the depth of their role in bringing into play spatial planning as an approach that has the capacity to make a difference.

Marcus Grant is a Senior Research Fellow in the WHO Collaborating Centre for Healthy Cities and Urban Policy at the University of the West of England in Bristol.
